

Digital Logic Gates

Boolean functions are expressed in terms of AND, OR, and NOT operations, it is easier to implement a Boolean function with these type of gates.

Name	Graphic symbol	Algebraic function	Truth table															
AND		$F = x \cdot y$	<table><tr><th>x</th><th>y</th><th>F</th></tr><tr><td>0</td><td>0</td><td>0</td></tr><tr><td>0</td><td>1</td><td>0</td></tr><tr><td>1</td><td>0</td><td>0</td></tr><tr><td>1</td><td>1</td><td>1</td></tr></table>	x	y	F	0	0	0	0	1	0	1	0	0	1	1	1
x	y	F																
0	0	0																
0	1	0																
1	0	0																
1	1	1																
OR		$F = x + y$	<table><tr><th>x</th><th>y</th><th>F</th></tr><tr><td>0</td><td>0</td><td>0</td></tr><tr><td>0</td><td>1</td><td>1</td></tr><tr><td>1</td><td>0</td><td>1</td></tr><tr><td>1</td><td>1</td><td>1</td></tr></table>	x	y	F	0	0	0	0	1	1	1	0	1	1	1	1
x	y	F																
0	0	0																
0	1	1																
1	0	1																
1	1	1																
Inverter		$F = x'$	<table><tr><th>x</th><th>F</th></tr><tr><td>0</td><td>1</td></tr><tr><td>1</td><td>0</td></tr></table>	x	F	0	1	1	0

Properties of XOR Gates

- XOR (also \oplus) : the “not-equal” function
- $\text{XOR}(X,Y) = X \oplus Y = X'Y + XY'$
- Identities:
 - $X \oplus 0 = X$
 - $X \oplus 1 = X'$
 - $X \oplus X = 0$
 - $X \oplus X' = 1$
- Properties:
 - $X \oplus Y = Y \oplus X$
 - $(X \oplus Y) \oplus W = X \oplus (Y \oplus W)$

Universal Logic Gates

NAND and NOR gates are called Universal gates. All fundamental gates (NOT, AND, OR) can be realized by using either only NAND or only NOR gate. A universal gate provides flexibility and offers enormous advantage to logic designers.

NAND as a Universal Gate

NAND Known as a “universal” gate because ANY digital circuit can be implemented with NAND gates alone.

To prove the above, it suffices to show that AND, OR, and NOT can be implemented using NAND gates only.

Boolean Algebra: In 1854, George Boole developed an algebraic system now called Boolean algebra. In 1938, Claude E. Shannon introduced a two-valued Boolean algebra called switching algebra that represented the properties of bistable electrical switching circuits. For the formal definition of Boolean algebra, we shall employ the postulates formulated by E. V. Huntington in 1904.

Boolean algebra is a system of mathematical logic. It is an algebraic system consisting of the set of elements (0, 1), two binary operators called OR, AND, and one unary operator NOT. It is the basic mathematical tool in the analysis and synthesis of switching circuits. It is a way to express logic functions algebraically.

Boolean algebra, like any other deductive mathematical system, may be defined with a set of elements, a set of operators, and a number of unproved axioms or postulates. A *set* of elements is any collection of objects having a common property. If S is a set and x and y are certain objects, then $x \in S$ denotes that x is a member of the set S , and $y \notin S$ denotes that y is not an element of S . A set with a denumerable number of elements is specified by braces: $A = \{1, 2, 3, 4\}$, i.e. the elements of set A are the numbers 1, 2, 3, and 4. A *binary operator* defined on a set S of elements is a rule that assigns to each pair of elements from S a unique element from S . Example: In $a * b = c$, we say that $*$ is a binary operator if it specifies a rule for finding c from the pair (a, b) and also if $a, b, c \in S$.

Axioms and laws of Boolean algebra

Axioms or Postulates of Boolean algebra are a set of logical expressions that we accept without proof and upon which we can build a set of useful theorems.

	AND Operation	OR Operation	NOT Operation
Axiom1 :	$0.0=0$	$0+0=0$	$\overline{0}=1$
Axiom2:	$0.1=0$	$0+1=1$	$\overline{1}=0$
Axiom3:	$1.0=0$	$1+0=1$	
Axiom4:	$1.1=1$	$1+1=1$	

AND Law

Law1: $A.0=0$ (Null law)
 Law2: $A.1=A$ (Identity law)
 Law3: $A.A=A$ (Idempotence law)

OR Law

Law1: $A+0=A$
 Law2: $A+1=1$
 Law3: $A+A=A$ (Idempotence law)

CLOSURE: The Boolean system is *closed* with respect to a binary operator if for every pair of Boolean values, it produces a Boolean result. For example, logical AND is closed in the Boolean system because it accepts only Boolean operands and produces only Boolean results.

_ A set S is closed with respect to a binary operator if, for every pair of elements of S , the binary operator specifies a rule for obtaining a unique element of S .

_ For example, the set of natural numbers $N = \{1, 2, 3, 4, \dots, 9\}$ is closed with respect to the binary operator plus (+) by the rule of arithmetic addition, since for any $a, b \in N$ we obtain a unique $c \in N$ by the operation $a + b = c$.

ASSOCIATIVE LAW:

A binary operator $*$ on a set S is said to be associative whenever $(x * y) * z = x * (y * z)$ for all $x, y, z \in S$, for all Boolean values x, y and z .

COMMUTATIVE LAW:

A binary operator $*$ on a set S is said to be commutative whenever $x * y = y * x$ for all $x, y, z \in S$

IDENTITY ELEMENT:

A set S is said to have an identity element with respect to a binary operation $*$ on S if there exists an element $e \in S$ with the property $e * x = x * e = x$ for every $x \in S$

BASIC IDENTITIES OF BOOLEAN ALGEBRA

- *Postulate 1(Definition):* A Boolean algebra is a closed algebraic system containing a set K of two or more elements and the two operators \cdot and $+$ which refer to logical AND and logical OR • $x + 0 = x$
- $x \cdot 0 = 0$
- $x + 1 = 1$
- $x \cdot 1 = x$
- $x + x = x$
- $x \cdot x = x$
- $x + x' = 1$
- $x \cdot x' = 0$
- $x + y = y + x$
- $xy = yx$
- $x + (y + z) = (x + y) + z$
- $x(yz) = (xy)z$
- $x(y + z) = xy + xz$
- $x + yz = (x + y)(x + z)$
- $(x + y)' = x'y'$
- $(xy)' = x' + y'$

- $(x')' = x$

DeMorgan's Theorem

(a) $(a + b)' = a'b'$

(b) $(ab)' = a' + b'$

Generalized DeMorgan's Theorem

(a) $(a + b + \dots z)' = a'b' \dots z'$

(b) $(a.b \dots z)' = a' + b' + \dots z'$

Basic Theorems and Properties of Boolean algebra Commutative law

Law1: $A+B=B+A$

Law2: $A.B=B.A$

Associative law

Law1: $A + (B + C) = (A + B) + C$

Law2: $A(B.C) = (A.B)C$

Distributive law

Law1: $A.(B + C) = AB + AC$

Law2: $A + BC = (A + B).(A + C)$

Absorption law

Law1: $A + AB = A$

Law2: $A(A + B) = A$

Solution: $\frac{A(1+B)}{A}$

—

Solution: $\frac{A.A+A.B}{A+A.B}$
 $\frac{A(1+B)}{A}$

Consensus Theorem

Theorem1. $AB + A'C + BC = AB + A'C$ Theorem2. $(A+B).(A'+C).(B+C) = (A+B).(A'+C)$

The BC term is called the consensus term and is redundant. The consensus term is formed from a PAIR OF TERMS in which a variable (A) and its complement (A') are present; the consensus term is formed by multiplying the two terms and leaving out the selected variable and its complement

Consensus Theorem1 Proof:

$$\begin{aligned} AB + A'C + BC &= AB + A'C + (A + A')BC \\ &= AB + A'C + ABC + A'BC \end{aligned}$$

$$=AB(1+C)+A'C(1+B)$$

$$= AB+ A'C$$

Principle of Duality

Each postulate consists of two expressions statement one expression is transformed into the other by interchanging the operations (+) and (·) as well as the identity elements 0 and 1. Such expressions are known as duals of each other.

If some equivalence is proved, then its dual is also immediately true.

If we prove: $(x.x)+(x'+x')=1$, then we have by duality: $(x+x)·(x'·x')=0$

The Huntington postulates were listed in pairs and designated by part (a) and part (b) in below table.

Table for Postulates and Theorems of Boolean algebra

Part-A	Part-B
$A+0=A$	$A·0=0$
$A+1=1$	$A·1=A$
$A+A=A$ (Idempotence law)	$A·A=A$ (Idempotence law)
$A+\bar{A}1$	$A·\bar{A}0$
$\bar{\bar{A}}A$ (double inversion law)	--
Commutative law: $A+B=B+A$	$A·B=B·A$
Associative law: $A + (B + C) = (A + B) + C$	$A(B·C) = (A·B)C$
Distributive law: $A·(B + C) = AB+ AC$	$A + BC = (A + B)·(A + C)$
Absorption law: $A +AB =A$	$A(A +B) = A$
DeMorgan Theorem: $\overline{(A+B)} = \bar{A}·\bar{B}$	$\overline{(A·B)} = \bar{A} + \bar{B}$
Redundant Literal Rule: $A + \bar{A}B=A+B$	$A·(\bar{A}+B)=AB$
Consensus Theorem: $AB+ A'C + BC = AB + A'C$	$(A+B)·(A'+C)·(B+C)=(A+B)·(A'+C)$

Boolean Function

Boolean algebra is an algebra that deals with binary variables and logic operations.

A Boolean function described by an algebraic expression consists of binary variables, the constants 0 and 1, and the logic operation symbols.

For a given value of the binary variables, the function can be equal to either 1 or 0.

Consider an example for the Boolean function

$$F1 = x + y'z$$
