

UNIT - 1

CD

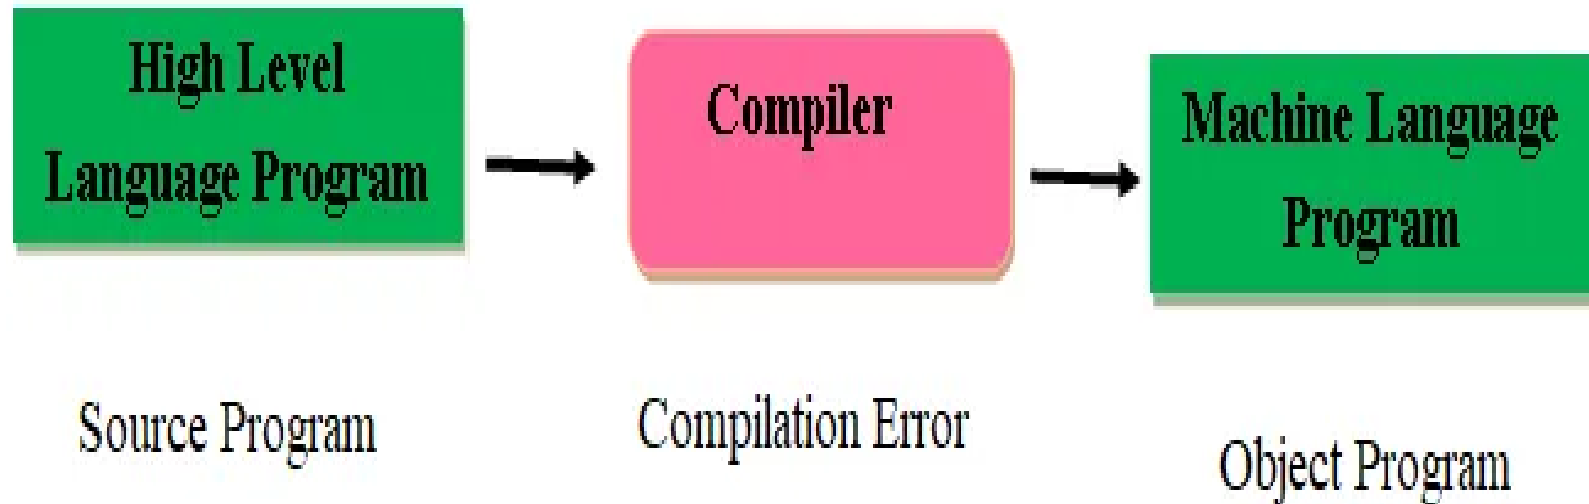

(Compiler Design)

What is Compiler?

Compiler is a software which converts a program written in high level language called Source Language to low level language (Object/Target/Machine Language).

It can be shown with the help of following diagram:

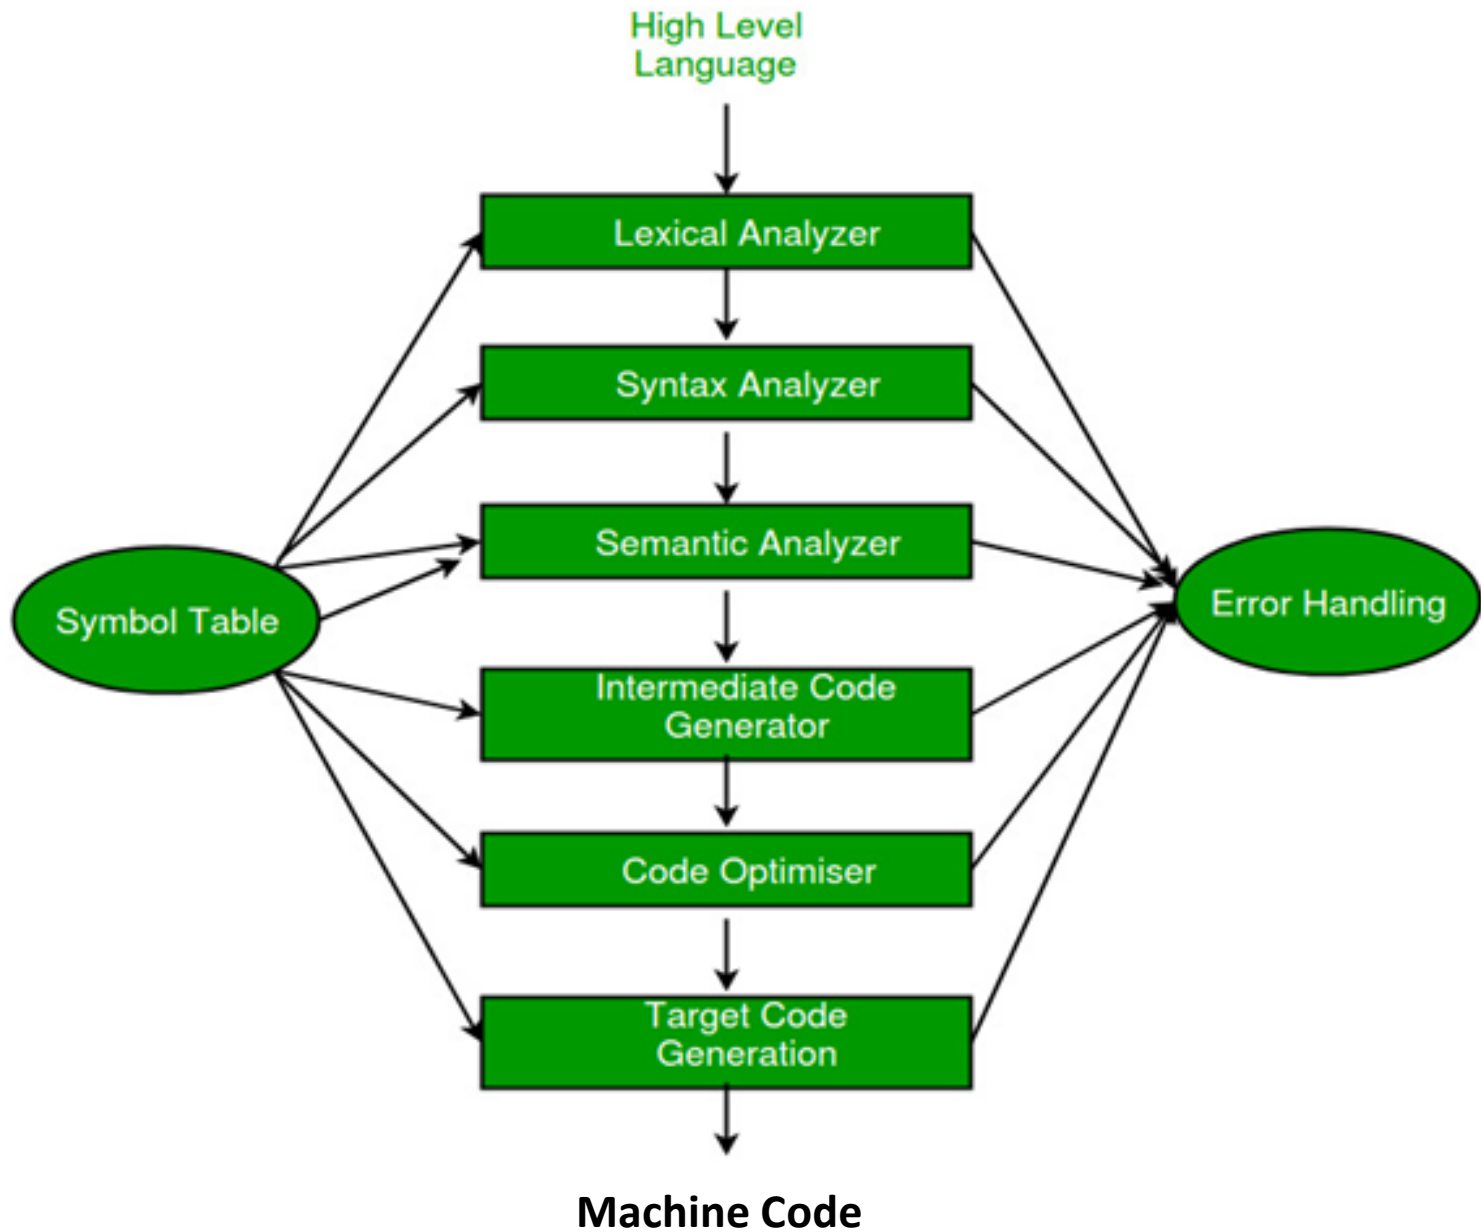

How Compiler Works

Phases of a Compiler

There are two major phases of compilation, which in turn have many parts. Each of them take input from the output of the previous level and work in a coordinated way.

- **Analysis Phase** – An intermediate representation is created from the give source code :
- **Synthesis Phase** – Equivalent target program is created from the intermediate representation.

Analysis Phase includes:

- Lexical Analyzer
- Syntax Analyzer
- Semantic Analyzer
- Intermediate Code Generator
